ABSTRAK

Problems speech delay in children is a serious problem that must be addressed because it is one of the causes of developmental disorders are most commonly found in children. Speech delay can be seen on the accuracy of the use of the word, which is marked with the pronunciation is not clear and can only communicate using sign language, so that parents and people who are nearby less can understand the child, although the child can actually understand what people are talking about. This speech delay will not only affect the personal and social adjustment of the child, but also can affect the child's academic adjustment. Speech delay (speech delay) in children, namely if the level of development of speech is under the level of quality of the speech development of children the same age can be determined by the accuracy of the word. This study aims to determine the factors that affect speech delays in children and also the stimulation provided by the parents and the environment in order to respond to these problems. The results showed that the factors affecting speech delay that occurs on the subject in this case. These factors are factors that affect speech delay include Barriers hearing,
