

## ABSTRACT

**LELI AFRIYENI.** *The Correlation Between Motivation Study With Remedial Study Result At Accounting Leason In Elevegrade SMA 107 Jakarta Timur.* Skript, Jakarta: Concentrate of Acconting Edukation, Study Program of Economic Education, Major of Economic and Administration, Faculty of Economic, State University of Jakarta, 2010.

*The research is aimed about at obtaining valid and factual information and knowledge about Correlation Between Motivation Study With Remedial Study Result At Accounting Leason In Elevegrade SMA107 Jakarta Timur.*

*The reserch applies survey method with correlational approach and survey data. Independent variabel in this study is motivation study and remedial study result dependent variabel. Population in this research is student to experience of remedial in elevegrade SMA 107 Jakarta Timur. While samples applied are 60 student. Sampling technique applied is simple purposive sampling that is sample of probabilita incondition of criteria from surveyor certained.*

*According to statistical computation the research the regression  $\hat{Y} = 48,82 + 0,178X$ . Resul of normality test of error estimation Y on X shows that the data are normality distributed because  $L_{hitung} < L_{tabel}$  ( $0,065 < 0,157$ ) which futher means that  $l_o < l_t$ . Based on regression meaning test it is know that regression model means because  $F_o (b/a) > F_t$  ( $15,32 > 4,17$ ). Conclusion From Statistical comutation is that the regression model of  $\hat{Y} = 48,82 + 0,178X$  is significant.  $F_o (TC) < F_t$  ( $1,69 < 2,70$ ) means regression model is linier. Based on hypothesis test with correlation coefficient test product moment is obtained  $r_{xy}$  0,581, this means there is positive correlation between motivation study with remedial study result.*

*Based on calculation t-test is known  $t_h > t_t$  ( $3,91 > 1,70$ ). This shows there is meaning full correlation between motivation study with remedial study result. While based on calculation contriution of motivation study to remedial study result to 33,76%, this shows level of contribution of motivation study to remedial study result to 33,76%. Result of this research has shown existence of positive correlation and significant between motivation study with remedial study result in the Elevegrade SMA 107 Jakarta Timur.*

*This means about that if motivation study increased that will so increase the same in number of remedial study result, and conversely if motivation study declined that will reduce number of remedial study result.*
