

ABSTRACT

AI SYATU HAMDIAH, The Correlation Between Effectivity of Usage In Studi Media and results of Study Economy The Students of KORPRI High School east Karawang west java. Thesis. Jakarta : Economic Education Study Program, Economic and Administration Department, Economic Faculty, State University of Jakarta, January 2009.

The aim of this research is to know the degree of equivalent between effectivity of usage in studi media and results of Study Economy the Students of KORPRI High School east Karawang west java.

The period of the research was Seven months, since July 2008 until January 2009. This research used survey methods by correlation approach. The population of this research were the Students of KORPRI High School East Karawang. The reached population were 105 students. The sampling technique was the proportional random sampling.

Equation of the simple linear regression give the formula of regression $\hat{Y} = 48,10 + 0,25X$. The analysis conditional test proved the validation on variable Y to variable X is normal distributed. It is proved by the calculation that used Liliefors test at significant level (α) = 0,05 that indicates L counted (0.0650) < L table (0,0865).

At the hypothesis test the significant and linear regression test are using variance analysis table (ANAVA). The result of the significant regression test indicates F counted (85,93) > F table (3,91). It state the formula of regression is significant. The result of the linear regression test indicates F counted (0,72) < F table (1,62). It state the regression model is linear.

The coefficient of correlation counted by product moment formula by pearson indicates $r_{xy} = 0,3636$. While the result of correlation coefficient significant test indicates t counted = 7,671 and t table = 1,684. Because the result shows t counted > t table, the research indicates there is a significant correlation between effectivity of usage in studi media and results of Study Economy. The counted of determination coefficient test indicates 0,3636, it means that 36,36% the variance of variable Y is determined by variable X.

The conclusion of research shown that a positive correlation which is strong enough between effectivity of usage in studi media and results of Study Economy the Students of KORPRI High School east Karawang . It means if effectivity of usage in studi media is increase, results of Study Economy the students of KORPRI High School east Karawang will increase.
